

INA Timing Chain KITS: now with an exclusive additive

SCHAEFFLER

FAG

 **RUVILLE**

Running like clockwork: INA Timing Chain KITS.

Over half of all newly registered vehicles in Europe are **chain driven**, and it's clear that this is an upward trend. Increasingly complex engines demand more and more from timing chains: During the run-in phase in particular, they are subject to **high loading conditions**. In the event of poor lubrication, there is a risk of premature wear caused by metal abrasion and elongation of the chain, with the worst possible outcome being engine damage.

Extra protection from Schaeffler and Liqui Moly

Working with oil and lubricant specialist Liqui Moly, Schaeffler has developed a **chain additive** that provides optimum lubrication. The additive, based on the low-friction lubricant MoS_2 , is applied directly when the chain and toothed gear are installed, forming a **heavy duty lubricating film**. This film reduces friction and guarantees smoother operation. As a result, the run-in wear of new parts is reduced by **up to 20%**, thus increasing the service life of the chain drive.

Exclusive for the Automotive Aftermarket

The chain additive has now been added to the INA Timing Chain KITS at no extra cost.

Benefits of the INA Timing Chain Additive

- Optimum lubrication for reduced friction and smoother operation
- Up to 20 % less run-in wear for an extended service life from the chain drive
- Included in all INA Timing Chain KITS
